Final Project Here are some announcements and suggestions regarding your final project.

1. I highly recommend students to link this final project as a part of your current research or own interest.
2. Topics may not include too simple ones. Your topic should be more than a natural extension from class work or homework.
3. By nature of parallel computing, seeking for iterative solution (toward certain convergence) and time-integration are discouraged. This is because these processes are purely sequential.
4. Good candidates include divisions of INDEPENDENT jobs to worker processors. If you want to parallelize any preexisting serial codes, look at the code and find parts contain independent calculations, which can be distributed to worker processors.
